Your phone, on your clock

schedule.u is a 121 KB Android app that switches the phone for you - at the times you choose, every day, without you lifting a finger. It does not remind you. It does the thing.

THE EVERYDAY PROBLEMS IT SOLVES

- **11:30 PM, one more video, and tomorrow is ruined.**
  Internet off (kill switch) and Do Not Disturb on at 11:30 PM - the phone cannot tempt you because it is offline. Nobody needs willpower at midnight when the Wi-Fi is already gone.
- **7 AM, phone still silent - the delivery call missed again.**
  Internet, Do Not Disturb and the ringer are restored before you wake. Your phone is loud exactly when the day starts, quiet exactly when it ends.
- **Mobile data left on overnight, battery quietly drained.**
  Data and Wi-Fi go off when you sleep and come back in the morning - same battery you went to bed with, and no background sync noise.
- **Meeting, class or exam - and the ringtone goes off anyway.**
  Silence from 9:55 to 11:30, weekdays only, automatically. No apology, no "sorry, forgot to mute".
- **Hotspot on, Bluetooth on, flashlight on - all day.**
  One schedule is a stack: hotspot off + Bluetooth off + flashlight off in the same step order. Anything you forget twice a day, schedule once.
- **Eyes burning at night, screen blinding in the dark.**
  Brightness drops to 15% at 10:30 PM and returns to 80% at sunrise. Auto-rotate and ringer follow the same clock.
- **Group chat buzzing at midnight.**
  Do Not Disturb is already on when the messages arrive. The chat keeps talking - your phone does not.
- **You would use airplane mode at night, but you are scared the alarm will not ring.**
  Airplane on at 11:30 PM and off at 7 AM. Android alarms still ring in airplane mode - only the network goes quiet.
- **You switched data off to save battery and forgot to switch it back on.**
  Mobile data and Wi-Fi return at 7 AM on their own, so your first job in the morning is not troubleshooting your own phone.
- **Travelling, odd shifts, kids with their own phone.**
  Alarms follow the wall clock through timezone changes; if a run is ever missed, the app runs it late and says so instead of staying quiet.

WHY IT WORKS WHEN REMINDERS DO NOT

+ **It switches, it does not nag.**
  No notification to swipe away - the setting already changed.
+ **No root needed.**
  A built-in kill switch cuts mobile data and Wi-Fi on any phone after one permission tap. Root or Shizuku add true radio switching (Wi-Fi, data, airplane, Bluetooth, hotspot, NFC).
+ **One schedule = many switches.**
  Stack as many steps as you like: data off, DND on, flashlight off, brightness 12%, ringer silent - in the order you set them.
+ **Ready on first launch.**
  "Sleep mode 11:30 PM" and "Good morning 7:00 AM" already exist the first time you open it - one tap and the nightly pair runs itself.
+ **Reliable and honest by design.**
  Exact alarms, alarm-clock fallback, re-arming on reboot, clock changes and every app open, a 30-minute catch-up for a missed run - and every run logged with what each step really did, so nothing fails silently.
+ **Yours alone.**
  121 KB, no account, no cloud, no ads - every schedule stays on the phone.

WHAT IT SWITCHES - HONESTLY

Always, on any Android 8+ phone: internet off / on (kill switch) - Do Not Disturb - ringer silent / vibrate / normal - media volume - brightness - auto-rotate - flashlight.

With Shizuku (free, no root) or root: Wi-Fi - mobile data - airplane mode - Bluetooth - hotspot - location - NFC - any shell command. Without either, those steps open the matching settings screen and say why.

THE 20-SECOND PITCH (SAY IT OUT LOUD)

> Your phone is silent when it should ring, and loud when you want peace. schedule.u switches it the way you actually live: internet and Do Not Disturb off at 11:30 PM, everything back at 7 AM. It does not remind you - it does it. No root. 121 KB. All on your phone.

WHO IT IS FOR

Night owls who lose sleep to one more video. Commuters whose data drains overnight. Anyone tired of toggling the same four switches every day.

THE ASK

Install scheduleu-2.5.apk, tap "Allow and arm" once, and the night/morning pair is already scheduled. That is the whole setup.
